# Task: Web Scraping from Almeera Online Store

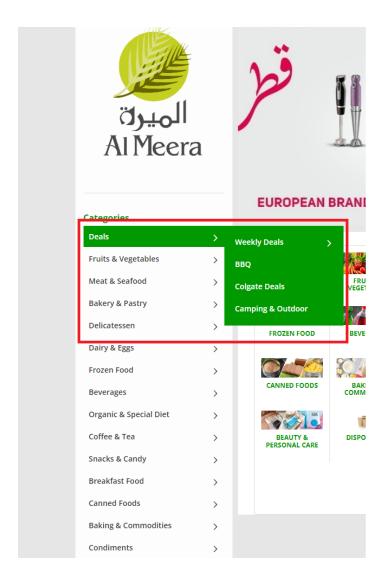

Please do not send us incomplete tasks, we greatly value your and our time. Incomplete tasks will not be entertained.

## **Objective:**

Extract specific data from Almeera Online involving multi-level category and product details, and store this data in a structured JSON format.

#### Levels to be Scrapped:

- Level 1: Category
- Level 2: Subcategories
- Level 3: Product Items

Scrap subcategories up to the highlighted level as show in the above picture

#### Details to be Extracted:

For Level 1 (Category Items):

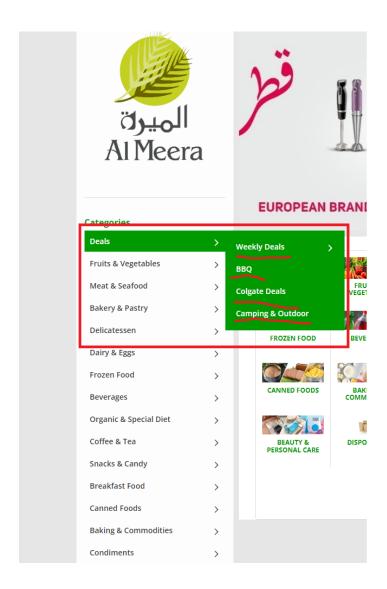

- Category title
- Category Image
  - o URLs
  - File (download)

Scrape all the categories.

For Level 2 (Subcategory Items):

Subcategory title

Scrape all subcategories of a category (do not scrape subcategories of subcategory)

For Level 3 (Product Items of subcategory):

- Product Image
  - o URLs
  - File (download)
- Item title
- Item price
- Item Barcode / SKU (if available)

Scrap 2 pages per subcategory Scrap only 5 products per page

#### Data Format:

Store the extracted data in a JSON format structured as follows:

( "CategoryTitle": "string", "CategoryImageURL": "string",

**BONUS: FOR THOSE WHO ATTEMPT THIS TASK USING,** 

"SCRAPY"

```
"Subcategories": [
       "SubcategoryTitle": "string",
       "Products": [
            "ItemTitle": "string",
            "ItemImageURL": "string",
            "ItemPrice": "string",
            "ItemBarcode": "string"
         },
            "ItemTitle": "string",
            "ItemImageURL": "string",
            "ItemPrice": "string",
            "ItemBarcode": "string"
         // Additional products...
       1
    // Additional subcategories...
  ]
}
```

#### Note:

- 1. Ensure the extraction of data adheres to legal and ethical standards.
- 2. Ensure the web scraping activity complies with the website's robots.txt guidelines.
- 3. Include appropriate waiting time between requests to avoid burdening the website's server.
- 4. Validate and clean the extracted data where necessary.
- 5. Ensure to manage pagination to navigate through multiple pages of products within each category/subcategory.
- 6. Consider implementing error handling to manage potential issues that might arise during the scraping process.

#### Deliverables:

1. Code File:

Provide the code script used to perform the scraping.

Data File:

A JSON file containing the scraped data following the provided structure.

3. Images folder:

A Folder that contains, the extracted images of the products

### How to submit the task

- 1. Create a git repository for the task and send the repository link over the email.
- 2. It should have
  - a. Code file
  - b. Data file
  - c. Images
